Data Dictionary for Malware Investigation Dataset

Field Name	Description	Possible Values / Format
`FileName`	Name of the memory dump file	String (e.g., `Win7_Pro_clean.raw`)
`OS_Version`	Operating system version installed on the VM	String (e.g., `Windows 7 Professional SP1 v6.1`)
`OS_Bit`	Operating system architecture	String (`32-bit` or `64-bit`)
`InfectionStatus`	Whether the system was infected or clean	String (`clean` or `infected`)
`MalwareName`	Name of the malware sample infecting the system	String (e.g., `WannaCry`, `GandCrab`, `Novirus` if clean)
`SnapshotType`	Indicates snapshot timing relative to infection	String (`pre-infection` or `post-infection`)
`FileFormat`	Format of the memory dump file	String (e.g., `raw`, `mem`)
`CaptureDate`	Date the memory snapshot was taken	Date format (e.g., `YYYY-MM-DD`)
`Notes`	Any additional remarks or experiment details	String (optional)

Notes:

- Each memory dump corresponds to a virtual machine snapshot taken either before or after malware infection.
- The `MalwareName` field is `Novirus` for clean system snapshots.
- Memory dumps are compatible with common memory forensics tools like Volatility.
